

Custom Islands: the guide

A picture-by-picture guide to **Custom Islands** (DynamicIslands), a [Raft](#) mod for the [Raft Mod Loader](#). It is for players who want new islands in their worlds, and for builders who want to make islands of their own. The [README](#) has the full reference (every setting, file and command); this guide shows you around.

The guide follows the heart of the mod first: **meeting custom islands** while you sail (sections 2-3), **building your own** in the editor (4-5), and giving them **stories**: quests, doors and keys, story items, and islands that bring other islands (6-7). Section 8 is about playing together. The **optional systems** that change a whole world - world rules, the world randomizer, the extra options, the island list and the level up system - are gathered in section 9, followed by the files, the console commands, help, and how to report a problem (section 13).

A custom island met while sailing: made by the mod's island generator, with Raft's own palms, rocks and reef.

Contents

1. Installing
2. Starting a new world
3. Sailing: custom islands in your world
4. Building your own island: the editor
5. Making islands come alive
6. Stories: quests, behaviours, story items
7. World plans: which islands a world gets
8. Playing together
 - Who needs what: every case

9. World settings: rules and extra systems

- 9.1 The World settings window
- 9.2 World rules: monster difficulty and build cost
- 9.3 The world randomizer
- 9.4 Extra options
- 9.5 Islands while sailing
- 9.6 The level up system

10. Settings files

11. Console commands

12. Questions and problems

13. Reporting a problem

1. Installing

Experimental Alpha Release: this is the mod's first release, an early alpha. Things are likely to change, some systems might be unstable, and progress is not guaranteed to be saved - back up the worlds you care about (Raft keeps them in `%USERPROFILE%\AppData\LocalLow\Redbeet Interactive\Raft\User`). The main menu shows this in the **EXPERIMENTAL ALPHA RELEASE** box at the top right, with the mod's version. **Got it** folds it into a slim bar (its **Show** opens it again); the mod remembers that for this version only (in `notice.txt`), so a new version shows the whole box again.

1. Install the **Raft Mod Loader** (RML) from raftmodding.com and start Raft through it.
2. Put `DynamicIslands.rmod` into Raft's `mods` folder (for example `...\steamapps\common\Raft\mods\`), or install the mod from its raftmodding.com page.
3. Start Raft with RML's **Play** button. The first start takes a little longer: RML compiles the mod.

The mod keeps its files in `<Raft>\Mods\DynamicIslands\`: your islands (`*.island`), the settings files (`spawnpool.txt` and others, see [section 10](#)) and the world plans (`plans\`).

Playing together? Every player needs the mod. The host's islands, files and settings are sent to everyone who joins (see [section 8](#)).

2. Starting a new world

Click **NEW WORLD** in Raft's main menu. Raft's box looks as it always does, with two things of the mod at the bottom right: the **Custom Islands plan** and the **WORLD SETTINGS...** button, which says how many settings differ from plain Raft.

Raft's New Game box with the Custom Islands plan (Random islands) and the World settings button.

Part	What it does
Custom Islands plan	Which custom islands the world gets: Random islands (they appear by chance while you sail), No custom islands , or a plan such as Adventure (a story from island to island; see section 7)
World settings...	Opens the World settings window: the world's rules, the world randomizer, the extra options and which islands turn up while sailing (section 9). The button reads <code>Raft's own</code> while nothing differs from plain Raft, otherwise how many settings you changed (<code>3 changed</code>)

Then click Raft's **Create** as usual. Your choices are remembered for the next new world. They belong to the world: saved with it, the same for every player, and every new world gets its own.

Just want new islands? Leave the plan on **Random islands**, leave World settings as they are (`Raft's own`) and create the world: islands turn up while you sail ([section 3](#)), and the rest of Raft plays as it always does. The World settings are optional extras for players who know Raft well; they are described together near the end of this guide.

The whole main menu. The EDITOR button opens the island editor (section 4).

What you can do on an island

Custom islands work like Raft's own: you can **walk** on them, the **raft runs aground** on them, and you can **chop** palms, pines, birches and mango trees and **pick up** rocks, ores, clay, sand, berries, pineapples, flowers and more. What you took **stays taken** (also after saving, loading and sailing away), and it **grows back** after 3 in-game days (the island's builder or `spawnpool1.txt` can change that).

On a generated tropical island: Raft's bamboo, palms and plants, placed where Raft's own islands have them.

A generated island with the Nature setting on "Jungle": you have to squeeze between the trees.

Diving: generated islands rise from a deep sea floor like Raft's own: a sandy shelf about 10 m deep with corals and sea plants, then a drop-off. Giant clams, silver algae, stones, ores, scrap and the seaweed on sea vines can be picked up.

Under water around a generated island: the shelf, the reef, the drop-off and the slope further down.

Flying and sunken islands: some islands float high in the sky (build stairs or pillars up from the raft), others lie under the surface for divers.

Notes, chests, zones and creatures

The builder of an island can give it much more than land (see [section 5](#)). In a world:

- **Notes:** look at a readable object (a sign, a paper, a bottle...) and press the interact key (**E**) to read it. Close it with E, Tab, Esc or the button.
- **Chests:** look at one and press **E**: the items go into your inventory. The chest is then empty for everyone until it fills up again (after the regrow days, or never). Some chests are **locked** until you have their key.
- **Trigger zones:** invisible areas that fire when a player walks in: a message, items, or an **ambush** (animals that appear the moment you step in).
- **Creatures:** Raft's own animals at the island's creature spots, with the builder's toughness, size and colour. Warthogs and bears fight you; chickens, goats and llamas can be caught with Raft's net launcher and kept on the raft. Killed and caught animals come back after the regrow days unless the builder said never.

A note found on an island ("Warthogs live here. Bring a spear."). Press E, Tab or Esc to close it.

Quests

An island with a quest shows a **quest panel** on the right when you arrive, with its steps: go somewhere, read a note, open a chest, defeat or catch animals, collect story items, find journal pages. Each step done shows what's next; the last one gives the reward to every player near the island.

The quest panel of "The lost camp" on the right: the first step is "Go to camp".

Quest complete: the banner, every step ticked in the panel, and the reward (planks and rope) in the inventory.

New islands from quests and rules

A finished quest (or a plan's rule) can **bring a new island**: every player sees a banner with a message and how far and which way it is, and the island's dot on the Receiver carries its name.

A rule brought a new island: "About 970 m to the south-east (on your Receiver)". The quest panel shows the finished step.

The journal (J)

Press **J** to open the journal: the crew's **story items** (keys, maps, logs...) with their pictures, and every note you have read, on paper. Story items belong to the whole crew, like Raft's own quest items.

The journal: two story items at the top left, the pages read below, and the page "The keeper's note" open.

4. Building your own island: the editor

Click **EDITOR** in the main menu. A loading box shows what it is doing ("Opening the editor", then "Loading Raft's objects from its islands" with a bar) until the editor is ready: a few seconds the first time after starting Raft, less after that. The editor opens on the sea with an empty build area.

The box that covers the screen while the editor opens.

4.1 The screen

The editor on the Terrain tab.

- **Top bar:** New, Open, Save, Save as · Undo, Redo · the three tabs **Terrain, Objects, Island** (F1, F2, F3) · **Generate** (the island generator), **World plans, Main menu**. The island's name is at the top left.
- **Tool panel** (left): the tab's tools in bordered groups. The lit button is the one in use.
- **Status bar** (bottom): explains the tool, or the button under the mouse. On the right: where the camera is.
- **The blue plane is the sea.** Everything below it is under water in the game.

Moving the camera (like Unity's scene view):

Do this	To
Right-drag	look around; while held, WASD flies where you look, Q/E go down and up, the wheel sets the speed
WASD or arrows	move over the island at the same height
Middle-drag	pan (the ground follows the cursor)
Alt + left-drag	orbit around the selection, or the middle of the view
Wheel	zoom towards what is under the cursor
F	frame the selection, or the whole island
Shift	three times faster

Undo and redo everything with **Ctrl+Z** / **Ctrl+Y**; save with **Ctrl+S**, open with **Ctrl+O**.

4.2 Shaping the land (Terrain tab)

- **Sculpt: Raise, Lower, Flatten, Smooth.** Hold the left mouse button on the ground; the white ring shows the brush.
- **Paint ground:** the style's four textures (for a tropical island Sand, Grass, Rock, Seabed). **Auto** textures an area by its height and slope again.
- **Brush:** size and strength.
- **Stamps:** click the ground to put down a **Hill, Peak, Crater, Mesa, Lagoon** or **Ridge**, as big as the brush (Q/E turn it). **Save stamp...** keeps the land under the brush as a stamp of your own.

Island styles. On the Island tab, **Style** ◀ ▶ switches between Tropical, Snowy, Desert, Forest and Volcanic: the ground takes the style's textures, the paint buttons get its names, and the generator uses its plants and animals.

The same kind of island in four styles, as the generator makes them: tropical palms, snowy pines, desert red rock, forest birches.

4.3 Placing objects (Objects tab)

The Objects tab: the tools on the left, the object browser on the right (713 of 1,947 objects loaded).

The **object browser** on the right has **every object of Raft**, about 1,900, each with a picture: nature, harvestable trees and rocks, Raft's 88 building blocks (to build huts or your own abandoned rafts), everything else you can build on a raft, and the objects of Raft's story islands (they load the first time you open their category). **Search** finds objects in every category.

- **Place:** click an object in the browser, then click the ground. **Q/E** turn it, **[** and **]** resize it, **Shift+click** keeps placing, **Esc** stops.
- **Select:** click a placed object; **Shift+click** adds more.
- **Transform** (keys 1-4): Move, Turn, Scale or All, with the coloured handles.
- **Selection:** **Ground** drops the selection onto the terrain, **Duplicate** (Ctrl+D), **Deselect**, **Delete**.
- **Placing:** **Random** gives each placed object a random turn and size, **Slope** leans it with the ground, **Grid** snaps to Raft's 1.5 m building grid (Q/E then turn in 90° steps).
- **Groups:** select several objects and click **Save as group....** The group appears under **My groups** at the top of the browser, to place on any island.

A herd of two warthogs (the pink marker) and a sign. "My groups" in the browser holds two saved groups.

Selecting a single object shows its **inspector** in the tool panel: creature settings, a note, loot, a zone, a colour, behaviours (see [section 5](#)).

4.4 The Island tab

The Island tab: style, height in the world, the generator, the name players see, the island's rules and its quest.

- **Style** and **Height** in the world: **At sea** (0), **Flying** (60 m up) or **Sunken** (30 m under water), or any number. The editor always shows the island at sea level; the height applies in the game.

- **Shown to players:** the island's **name**, your name and a short welcome. Players see them as a banner.
- **Rules:** how many in-game days until chopped trees, picked items, killed animals, looted chests and fired zones come back on this island (empty = the world's setting, 0 = never). **Level up system** Off / On: see [section 9.6](#).
- **Quest, Islands it brings, Island events, Story items:** see [section 6](#).

4.5 The island generator

Generate (top bar) makes a whole island for you to start from. The **preview** map on the right follows every change; the line under it says how big the island is and how many objects it will get. The **seed** picks one island of all possible ones: the same seed and settings always give the same island. Every setting has a ? to hover. Generating replaces the island you have; **Ctrl+Z** brings it back.

The Normal tab: your presets, the style and layout, the size and height (with buttons for the size and height of Raft's own small island, large island and Balboa), peaks, hills and the coast.

- **Island:** the **style** and the **layout**: round, atoll, archipelago, sea stacks, plateau, marsh, crescent, twin peaks.
- **Size and height, coast and outline, land features:** peaks and their shape, hills, coast, bays, beach, cliffs, stretch, valleys, lakes, terraces, erosion.
- **Under water:** a **deep sea floor like Raft's** (a shelf about 10 m deep, then a drop-off) or a **shallow** one (a flat seabed 20 m down), the width of the shallow water, how steep the drop-off is, and the seabed (sand, rocky, or a reef ring).
- **Nature:** trees, bushes, rocks, beach things and harvestables, with quick buttons **None, Sparse, Like Raft, Dense** and **Jungle**. "Like Raft" places everything where Raft's own islands have it: a nearly bare beach, palms inland on grass, boulders on steep ground.
- **Life under water:** corals, sea vines, kelp, rocks, stones, ores, giant clams and sunken barrels, placed like around Raft's own islands.
- **Animals:** hostile creatures (the style's own, or the kinds you click), how tough (Easy, Normal, Hard, Boss), friendly animals to catch, sea creatures.

- **Loot:** how many loot boxes, their lowest and highest **tier** (1: planks and plastic ... 5: titanium, explosive goo, batteries), in the open or hidden.
- **My presets:** **Save these settings...** keeps them under a name; **Defaults** starts over.

Further down the Normal tab: the land features, the Under water group (Deep, like Raft) and the Nature quick buttons. Hovering a ? shows its help (here Stretch).

The bottom of the Normal tab: things to collect, sunken barrels, animals (the kinds to click, the toughness) and loot.

Can players reach it? Above the seed, a coloured line says whether a player arriving by raft can get onto the island: **Easy** (beaches, walk to the top), **Reachable**, **Possible but tricky** (a jump onto a low ledge),

Possible but unlikely, or Not from the raft without building (cliffs all around: players need stairs, a ladder or foundations). It is worked out with Raft's own player: how steep it can walk, how high it jumps.

A cliff island: "Not from the raft without building: cliffs all around (the lowest ledge is 17 m above the water)."

Randomize existing: click one of Raft's 33 islands (each has a picture). **Something new like it** makes a new island with its size, height and look; **A variation of it** starts from the island's own ground and reshapes it (stretch, mirror, roughen, coast, valleys...).

Randomize existing: Raft's islands, measured, with a picture each. Here a variation of "Big Island OG".

A variation made from one of Raft's big islands, opened in the editor.

A generated island in the editor, ready to change: its trees and bushes are ordinary objects you can move or delete.

The editor's view under water shows what a deep sea floor looks like:

A generated island on the deep sea floor: the shelf and drop-off from above, the slope, the reef, the drop-off.

4.6 Ready-made islands (map types)

The generator's **Ready-made (with content)** tab makes whole islands with a story: chests, notes, creatures, zones and a quest, from a seed. Click a card, then **Make** (click twice): the island is saved as `gen-<type>-<seed>` and opened for you to change.

The Ready-made tab: plain islands of each style, and the map types with their content.

Some map types: an archipelago (a castaway's caches), an atoll, sea stacks (a chest on the tallest), a boss island, an old camp, and a treasure island in a world, its quest panel saying "Find the map on the beach".

Map type	What it is
Sandbar	A tiny island with a few palms and a small chest: a rest stop
Atoll	A ring of land around a shallow lagoon
Archipelago	Several islets; a castaway's note and three caches
Sea stacks	Steep rock pillars; a chest on top of the tallest (build your way up)
Boss island	A plateau with cliffs and a ramp; the arena wakes a boss bear
Volcano, swamp, frozen spire	A tall volcano with embers; low land with pools and mist; a snowy peak with a cache on top
Treasure island	A map in a bottle on the beach leads to the X and a treasure chest
Old camp	An abandoned camp with a notice board and supplies: a good first island of a story
Sunken island, sky island	Under water, with corals, sunken barrels and puffer fish; floating 45-90 m up with a cache
Wreck, ghost raft	No land: an abandoned raft of Raft's own blocks, floating like a real raft (the deck just above the water). A wreck has barrels to loot; a ghost raft is small, medium or large with a note, and the large ones are guarded by rats and screechers (9.4)
Oddities, boss lair, large island	The world randomizer's islands (section 9.3)

4.7 Saving and sharing

Save (Ctrl+S) saves straight away once the island has a name; **Save as** and **Open** show the **Islands** window: a name, the height in the world, and your saved islands (click = pick, double-click = open, Delete asks first).

The Islands window: the name and height, and the saved islands with their date and size.

Islands are files in `<Raft>\Mods\DynamicIslands\ (<name>.island)`. In multiplayer the host's island files are sent to players who don't have them, so nobody needs to share files just to play together ([section 8](#)).

Sharing an island or a plan: Export. In the Islands window, pick an island and click **Export...**; in the World plan window (a plan open) click **Export....** The **Share** window says what goes along:

- an island takes the islands its rules bring with it ("Palm Cove + 1 island it brings: Treasure Cove"), and theirs, so its quest chain still works for whoever gets it;
- a plan takes every island it needs. Rules of the kind "a new island of a map type" need no file (every player's mod makes those), and islands from the spawn pool come from each player's own islands;
- if one of those islands isn't saved, the export stops and names it.

Fill in the **title**, **author** (your Steam name to start with), a one-line **summary**, a **description** (what players find, how long it takes, what you had in mind, e.g. "best with Fierce monsters" - a pack never sets difficulty or other World settings; the player's own choices always apply), **tags**, **players** and **length**, and whether **others may change it and share their version** (they must credit you either way). The **picture** is what the editor's camera shows: close the window, move the view, open it again, or click **Take picture**; its middle becomes the icon. **Export** writes a pack, `Mods\DynamicIslands\exports\<name>.zip`; **Open folder** shows it; **Share...** opens the island library's page to send it in. Export the same island or plan again later and the pack is the next version of the same entry (so whoever has it can update it).

The Share window: what goes along, the entry's info on the left, the picture of the editor's view on the right.

Getting islands from a pack: Import. Put a pack (.zip) you got into `Mods\DynamicIslands\import` (**Open import folder**), click **Import...** in the Islands window or the World plan window, and pick it: the window says what it holds, who made it and its version. **Install** puts it in place:

- **Your own files are never overwritten.** If you have a different island with the same name, the pack's is installed as `Name (Pack title)` and the pack's plan and islands are changed to use that name. The same island (the very same file) is shared, not copied. A plan whose name you already use gets the author added: `First Voyage (Author)`.
- An **island** from a pack only turns up by chance while sailing if you tick **Also let it turn up while sailing** - then also in worlds you've already started with random islands (you can untick it for a new world in World settings, 9.5). A **plan's** islands never turn up at random: they come when the plan brings them.
- A pack made with a **newer version** of the mod says so: "Install anyway" may leave out things this version doesn't know, and a quest that needs them may not be finishable. An island file of a newer *format* can't be read at all and is refused ("update the mod").
- A broken or harmful pack (too big, too many files, a file that would land outside the mod's folder, a program, not an island file) is refused with the reason, and nothing is written.
- Installing a newer version of something you installed **updates** it. Worlds you've already started keep the version they started with (the old file stays for them). If you changed one of its islands in the editor, yours is kept unless you tick **Replace files I changed**.

Installed from packs lists everything you installed, with **Remove** (click twice). Remove deletes what the entry installed but keeps anything a saved world still uses (it says which world), and never touches your own islands and plans. Under it, the copies of islands you got from multiplayer hosts (`<name>_<code>` , there can be many): **Remove unused** deletes the ones no saved world on this PC uses.

The Import window: packs in the import folder, what the picked one holds, and what's installed.

Import is offered in the island editor (the Islands and World plan windows), never inside a running world.

4.8 Your first island, step by step

1. Main menu → **EDITOR**.
2. **Generate** → Normal tab: Style **Tropical**, click **Small island**, Nature **Like Raft** → **Generate**.
3. **Terrain** tab: raise a hill, paint a sandy path, stamp a **Lagoon**.
4. **Objects** tab: search "chest", place a **Chest**, click **Add items...** and pick some loot.
5. Place a **Sign** from "Notes & signs", click **Edit note...**, write a welcome.
6. **Island** tab: give it a name ("Skull Rock") and your name.
7. **Save** (Ctrl+S), type a name, Enter.
8. Main menu → **NEW WORLD** → create a world. Your island takes part in the Random islands plan, or press F10 and type `SpawnIsland <name> 250` to have it appear 250 m ahead right away.

5. Making islands come alive

Select an object to see its **inspector** in the tool panel. Everything here can be undone.

5.1 Creatures

Open **Animals: hostile**, **Animals: catchable** or **Sea creatures** in the browser and place an animal: warthog, pig, bear, polar bear, hyena, rats, roach, bee swarm, screecher; chicken, goat, llama; puffer fish, angler fish, turtle, stingray, dolphin, whale.

A warthog spot: a herd of 3, health $\times 2$, damage $\times 1.5$, comes back after 3 days, appears at once.

- **Animals here:** 1 to 8 (a herd).
- **Easy / Normal / Hard / Boss**, or set **health**, **damage**, **speed** and **size** yourself.
- **Comes back after** the regrow days, or **Never**.
- **Appears** at once, or **when a zone fires** (an ambush, see 5.4).
- **Colour** (every object): a swatch, the strength, or your own mix.

In the editor a creature is a coloured marker with its name, or Raft's real model once you have been in a world since starting Raft:

Creature spots with Raft's own models: a warthog, a llama, a bear, a chicken.

5.2 Notes and signs

"Notes & signs" has a paper, a bundle of papers, an open book, a sign, a notice board and a message in a bottle, and **any object can be made readable (Add a note to it...)**. A sign shows its note's title on its board.

An object with a note: its title "Hidden treasure" and the start of the text.

The note editor: the title, the text (Enter starts a new line), and a preview of the paper players will see.

5.3 Chests and loot

"Loot & chests" has chests, a crate, a wooden box and barrels, and **any object can hold loot (A chest...)**.

A chest's loot: planks, plastic, palm leaves, rope and nails. The Basics, Metal, Food and Treasure sets fill it quickly; it fills up again after 3 days, or never.

Add items...: every item of Raft with its picture and a search. Click an item to add one, again to add more.

5.4 Trigger zones and ambushes

A **trigger zone** ("Zones & triggers") is an invisible sphere. When a player walks in it shows your **message**, **gives items**, and wakes the creatures that wait for it. It fires **once** per world (again after the regrow days) or **every time**.

A trigger zone (the orange sphere): its name, size 10 m, the message "You hear grunting...", fires once, and one creature spot waits for it.

The warthog's **Appears** is set to "when zone-158 fires": its name tag says it waits. It appears the moment a player walks into the zone.

Invisible walls and ramps (also in "Zones & triggers") are solid in the world but not seen: block a path, fence an arena, or make a cliff climbable.

5.5 Atmosphere and sound

An **atmosphere zone** changes the fog colour, the light and adds particles (fireflies, mist, snow, embers) around a spot; a **sound zone** plays one of Raft's 500+ sounds while a player is inside, or once on entering.

An atmosphere zone: its size, fog colour and strength, light tint and strength, and particles (fireflies).

Fly the camera into the zone to see it: purple fog and fireflies.

Choose sound...: Raft's sounds with a search. ► listens, Use picks it.

6. Stories: quests, behaviours, story items

6.1 Quests

Island tab → **Edit quest...**: a title, an introduction (shown when players arrive), up to 10 steps in order, a reward and a closing message.

The quest "The lost camp": go to the camp, read the diary, open the supplies, chase off 2 warthogs. The reward is planks and rope, and when the quest is done it brings a saved island "Old camp" 700 m north, with a message and a name on the Receiver.

Steps: **go to** a trigger zone, **read** a note, **open** a chest, **defeat** or **catch** a number of animals, **collect** a number of a story item, **find** journal pages. Steps point at things on the island by name; the editor lists the names it knows.

6.2 Behaviour and events

Select any object → **Behaviour + events....** No code needed:

- **A name** that actions refer to (objects with the same name act together).
- **Movement**: spin, bob, move back and forth, or **open and close** like a door, gate, bridge or lift (with a Preview in the editor).
- **At first**: there, or **hidden until shown** (a hidden creature spot is an ambush).
- **Players can use it**: Raft's "press E" hint with your own text ("Pull the lever").
- **Collision**: Raft's own, walk through, one box, or solid.
- **When ... then**: when a player uses it, walks into a zone, reads a note, opens a chest, or all the animals of a spot are defeated → show / hide objects, open / close doors, say a message, give items, play a sound, teleport the player, send a signal, write a journal page, or **wait** some seconds first.

- **Only if**: the player **has** an item or story item (or **uses one up**, like a key), an object is open, closed, shown or hidden, a signal was sent, the quest reached a step. Turn a check round with **not**; ask for **all** or **any** of them. **Otherwise** say a message.

A log named "lever" that players can use ("Pull the lever"): it opens or closes the door and says "The door moves".

A door that opens only if the player has the story item "rusty key"; otherwise it says "It's locked. Maybe there's a key somewhere..."

Island events (Island tab): actions for when players first come to the island and when its quest is done.

Island events: what happens when players first come to the island, and when its quest is done.

6.3 Story items and story sets

Island tab → **Story items...**: keys, map pieces, logs... with a name, a description and a picture (Raft's quest item pictures or any Raft item). Chests, zones, quest rewards and "give" actions hand them out; "only if" checks ask for them; players find them in the journal (J).

Story sets place a ready piece of a story in one step: **a locked door and its key** (in a chest with a note), **a trail of notes** leading to a hidden chest, **a treasure map** (a bottle gives the map; the X digs up a chest only for someone who has it), or **a locked chest** whose key is hidden in driftwood nearby.

The Story items window: the island's story items ("Old key") and the four story sets.

6.4 Islands that bring islands

Island tab → **Islands it brings...** gives the island its own rules: "when my quest is done", "when step 2 is done", "when zone X fires" or "when players first get here" → bring a saved island or a new island of a map type, how far and which way, with a message and a name on the Receiver. A chain of shared island files is a story on its own.

An island rule: when this island's quest is done, bring a new island of a random type 600 m north, with the message "Well done" and the name "Reward" on the Receiver. The map on the right sketches where islands go.

7. World plans: which islands a world gets

A **world plan** is a list of rules; each rule brings one island: **what** (a saved island, a new island of a map type, one from the spawn pool), **when** (the world starts, after N km, on day N, a quest done, a zone fired, players reach an island, a signal, after another rule), **where** (ahead of the raft, or near an island in a direction) and what players are **told**.

Choose a plan in the New Game box (**Custom Islands plan**). The mod comes with:

- **Random islands**: islands by chance while sailing (the default), **No custom islands**,
- **Island hopping**: an old camp, then each island you reach shows the way to the next,
- **Adventure**: a story where each quest leads to the next island, with a wreck and a sunken island on the way,
- **Growing sea**: random islands plus a special one every few km and days.

Make your own with **World plans** in the editor's top bar:

The Adventure plan: rules for a camp at the start, islets and a beast's plateau after the quests, a treasure island, a wreck after 2 km and a sunken island after 5 km. The map on the right sketches where they go.

New, Copy, Delete, Templates... (ready-made sets of rules), **random islands while sailing** on or off, **Check** (lists rules that can't work), **Export...** / **Import...** (share a plan with every island it needs, see 4.7), **Save**. Plans are text files in `Mods\DynamicIslands\plans`. In a world, `WorldPlan` shows the plan and which rules have fired; the host can give the world another plan with `WorldPlan <name>`.

A world keeps its own copy of its plan. When a world starts, the plan's rules are saved with the world. From then on the plan file is only a template for new worlds:

- editing, updating or deleting the plan file never changes a world that is already being played (to give a running world the plan as it is now, use `WorldPlan <name>` in it);

- the world's plan goes along when someone else hosts the world later ([section 8](#)), even if they never had the plan;
- worlds saved before this version get their copy the next time they're saved on a PC that has the plan file.

A plan can only bring islands that are on the host's PC. If one is missing, the host sees which island and where it came from (the pack or library entry, or "ask the player who made this world"), and the rule waits until the island is there.

The plan decides which islands come, when and where - nothing else. Monster difficulty, build cost, the level up system, the randomizer and the extra options are chosen in World settings for each world, whatever plan it has.

8. Playing together

Up to eight players (Raft's maximum). **Every player needs the mod.**

- **The host decides, for everyone:** the islands, the plan, the World settings (world rules, randomizer, extra options, which islands turn up while sailing; [section 9](#)), and the host's `spawnpool.txt` settings that change what players see (regrow days, Receiver dots, unload distance). A player's own files and last New Game choices never change the host's world, and only the host can change its settings.
- **Players who join** (or join again, or after a restart) get all of it: the islands and any island files they don't have, what was chopped, picked, looted and fired, doors and levers, quests, the crew's journal, where they stood on an island, and the tough animals' health.
- **Shared:** harvesting and pickups, chests (when several players open one at the same moment, the first gets it), zones, doors, quests and their rewards, story items, the journal. Things that move follow a clock all players share, so everyone sees them in the same place.
- **What grows back** is the host's decision: things come back when the island loads on the host after the regrow days; a player who has the island loaded sees it the next time it loads there.
- **Joining:** use Steam's "Join Game" on a friend (Raft's own Join World list is empty in this Raft version).
- **Someone else hosts next time:** Raft keeps the world on the host's PC. Copy its folder (`%USERPROFILE%\AppData\LocalLow\Redbeet Interactive\Raft\User\User_<Steam id>\World\<world name>`) to the new host's PC, into their own `User_<Steam id>\World`. The custom islands, what was used, quests, the journal, everyone's levels, the world's rules and its plan come along: the folder carries the mod's copy (`CustomIslands.txt`), and every player who joined keeps one too. Islands you only have from joining are used from their downloaded copies. Islands the plan hasn't brought yet are the one thing the new host may not have - see the table below.
- **Levels** (with the level up system on): each player's own, kept by the host and back when they join again; the host works out everyone's EXP, and each player sees the others' levels under their names.

Who needs what: every case

Only **the host's** islands, plan and settings count in a game. Players who join need **the mod, nothing else:** no islands, no plans, no packs. What they're sent is kept on their PC (islands as `<name>_<code>`), which is what lets them host the world later.

Case	What happens	What anyone has to do
A hosts, B joins (any number of players, joining and leaving any time)	B gets every island that has appeared, with what was chopped, looted and fired, the quests, the journal, levels and settings - also after leaving and joining again, or a crash	Nothing
A adds islands while B plays (a plan's rule, a random island, a spawned one)	B gets each new island as it appears	Nothing

Case	What happens	What anyone has to do
B hosts A's saved world later , A joins	B uses the world's own copy (it comes in Raft's world folder, and B kept one while playing): the islands that appeared (from what B was sent), what was used, quests, journal, levels, World settings, and the plan	Copy the world folder to B (below). If the plan still has islands to bring that never appeared, B doesn't have them: B sees which ones. A exports the plan (4.7) and B imports it, or B gets it from the island library
A world made from a pack or library plan hosted by someone who never installed it	As above; the message names the pack or library entry	Install that pack or entry
A world saved before worlds kept their plan (older versions), hosted by someone without the plan file	The plan's remaining rules can't run: the host is told when the world loads	The first host saves the world once with this version (the plan is then in the world), or gives the plan file
The plan is edited, updated or deleted while worlds use it	Worlds already started keep their own copy	Nothing (WorldPlan <name> in a world to switch it on purpose)
An installed island is updated while a world uses it	That world keeps the version it started with; new worlds get the new one	Nothing
You remove a pack that a saved world uses	What the world uses is kept (you're told which world)	Nothing
A pack's island has the name of one of yours	Installed as Name (Pack title); yours is untouched	Nothing
A pack was made with a newer mod version	A warning; "Install anyway" may leave out what this version doesn't know	Update the mod if something's missing
An island downloaded or imported later , in a world with random islands	Only turns up if you allowed it (import) - also in worlds already started; a plan's islands never do	Untick it for a new world in World settings (9.5)
Different players have different islands with the same name	The host's is used; others get the host's as a copy and keep their own	Nothing

Moving a world to another host: Raft keeps the world on the host's PC in

%USERPROFILE%\AppData\LocalLow\Redbeet Interactive\Raft\User\User_<Steam id>\World\<world name>. Copy that folder into the new host's own User_<Steam id>\World. It carries the mod's copy of the world (CustomIslands.txt), so the custom islands, the plan, what was used, quests, the journal, levels and settings all come along.

9. World settings: rules and extra systems

Everything in this section is **optional and separate from island building**: switches that change how a whole world plays, for players who know Raft well and want it different. None of them is needed to make or meet custom islands, and a world where they are all left alone plays as plain Raft plus your islands.

- **World rules** (9.2): tougher or softer monsters, a dearer build menu.
- **World randomizer** (9.3): a normal Raft world made different every time: colours, alphas, finds, odd islands, bosses.
- **Extra options** (9.4): scrambled blueprints, the story islands in a new order, ghost rafts, private storages.
- **Islands while sailing** (9.5): which of your islands a world may meet.
- **The level up system** (9.6): EXP and stat points, switched on by an island rather than in the window.

All of them belong to the world: chosen when it is created, saved with it, the same for every player (the host's), and they come along when the world moves to another host ([section 8](#)).

9.1 The World settings window

Everything else the mod lets you choose for a new world is in one window, in four groups. Each part has a ? or an explanation. **Raft's own** puts every setting back to plain Raft; **Done** closes the window.

The World settings window: the world rules and the world randomizer on the left, the extra options on the right.

Group	What it does
World rules: monster difficulty	How tough monsters are in this world: Timid, Normal, Fierce, Savage or Nightmare (see section 9.2)

Group	What it does
World rules: build cost	How many more materials the build menu costs: Raft's own up to +100 %, rounded up
World randomizer	A normal Raft world made different: Off, Light, Normal or Wild, and which parts take part (click a part to switch it off; see section 9.3)
Extra options	More ways to play Raft again, for players who know it by heart: each switched ON or off with its own button (below)
Islands while sailing	Which of your islands (and which kinds of new islands) turn up by chance while you sail in this world: CHOOSE ISLANDS... opens the list (below)

Raft's own sets monsters to Normal, the build cost to Raft's own, the randomizer to Off and every extra option to off (it leaves the island list alone). The line at the bottom of the window sums up what the world will get. Nothing is final until you click **Create** in the New Game box.

In a world the host can change every group with a console command (F10); every player gets the change at once:

Group	Show it	Change it (host)
Monster difficulty	Monsters	Monsters savage
Build cost	BuildCost	BuildCost 25
World randomizer	Randomizer	Randomizer wild, Randomizer -alphas +bosses
Extra options	WorldOptions	WorldOptions +ghostrifts -privatetestorage
Islands while sailing	WorldIslands	WorldIslands -<island>, WorldIslands +<island>, WorldIslands all

9.2 World rules: monster difficulty and build cost

Monster difficulty

Level	Monsters' health	Damage they deal to players
Timid	×0.75	×0.75
Normal	×1 (as Raft made them)	×1
Fierce	×1.25	×1.25
Savage	×1.5	×1.5
Nightmare	×2	×2

Monsters are the animals that fight players, on Raft's islands and custom ones: sharks, warthogs, bears, polar bears, screechers, puffer fish, rats, hyenas, bees, angler fish, the butler bots and the bosses. Left as Raft has them: puffer fish damage, and everything about Bruce and your raft (his bites on it, how often he comes, how soon he comes back). In Peaceful and Creative monsters can't hurt you, so only their health changes.

Build cost

Everything in the **build menu** (the hammer's foundations, floors, walls, roofs, stairs...) costs **0-100 % more**, always rounded up: at +50 % one plank becomes two, two become three, three become five. Removing a block gives back half of what it cost (as in Raft), and repairing and reinforcing cost more too. The crafting menu (Tab) costs the same as in Raft.

Both rules are the host's for every player, also players who join later. The host can change them in a world: **Monsters savage**, **BuildCost 25**. At the main menu the same commands set the choice for the next new world.

9.3 The world randomizer

The randomizer makes a **normal Raft world** play out differently every time, with or without custom islands, and without touching Raft's story (the radio tower, Vasagatan, Balboa, Caravan Town, Tangaroa, Varuna Point, Temperance and Utopia stay as they are). Choose it in the World settings window (New Game box, **WORLD SETTINGS...**): **Off**, **Light**, **Normal** or **Wild**, and which parts take part. The level sets how often things happen:

	Light	Normal	Wild
Animals in another colour	about 15 %	about 30 %	about 55 %
Alpha fighters (sharks)	about 3 % (6 %)	about 6 % (12 %)	about 12 % (22 %)
An oddity island (after the first 1.5 km)	about every 12 km	about every 7 km	about every 4 km
A large island (after the first 3 km)	about every 20 km	about every 10 km	about every 7 km
A boss lair (after the first 4 km)	about every 40 km	about every 20 km	about every 12 km

The parts (all on unless you click one off):

Part	What you'll find
Colours	Animals and sharks (Bruce too) now and then in another colour: charcoal, ash, rust, moss, frost, night... and rarely a gold shark
Animals	More animals on Raft's islands, now and then puffer fish on the reef
Alphas	Rare bigger, darker alpha warthogs, bears, hyenas and screechers (3× health), and a huge Big Bruce . A banner warns you. Killed, they drop a trophy head , meat and leather
Loot	Some of the crates and giant clams on Raft's islands lie in other places; now and then extra crates and barrels
Finds	A treasure hunt (a map in a bottle on the beach leads to a buried chest), an abandoned camp , a castaway's stash , and on Raft's big islands a den with a guard and a hoard
Oddities	Small odd islands while you sail: a van, a caravan, a crashed plane, a stranded boat, a hermit's shack, a statue, rocket debris, a hut of raft blocks
Bosses	Now and then a boss lair : climb the plateau and a named beast (Old Ironhide, Frostfang, Ashmaw, the Tusk King, the Laughing One) wakes with two guards

Part	What you'll find
Large	Now and then a large island as big as Raft's big ones, with a made-up name, animals, hidden loot, scenes from the quest islands and a den

The oddity islands. Each has loot, a note and a banner with its name when you arrive.

Large islands: tropical or snowy, with warthogs and animals to catch, a made-up name ("Coral Cay") and a den whose guard wakes when you walk in ("Something moves in the dark...").

Scenes on large islands, made from the props of Raft's quest islands, each with a chest and a note.

The Finds part can put a den on one of Raft's own big islands: a rock outcrop with a den inside, a guard and a hoard.

Changing it later: Randomizer (F10) shows what it does in your world; the host can change it, for example Randomizer wild or Randomizer -alphas. Everything follows from the world's seed, so every player sees the same colours, alphas and crates.

9.4 Extra options

More ways to play Raft again. Each option has its own button in the window's right column, switched **ON** or off, with an explanation under it. They can be combined freely.

Scrambled blueprints

The blueprints lying on Raft's story islands (Vasagatan, Balboa, Caravan Town, Tangaroa...) are swapped with each other, so each is found on another story island than usual. The pickup's name tells you which blueprint

you'll get. The pairs come from the world's seed: every player finds the same blueprint in the same place, and no blueprint stays in its own place. What the story needs is **never moved**: the Receiver and antenna, the steering wheel, the engine and its fuel, the machete, the zipline and the headlight, so the story can always be finished. Only what a pickup gives changes; which pickups there are, and which were taken, stays Raft's. Switching the option off (`WorldOptions -blueprints`) puts what is left in the pickups back to Raft's own.

Story islands in a new order

Radio Tower, Vasagatan, Balboa, Caravan Town, Tangaroa, Varuna Point and Temperance come in a shuffled order. Raft has no fixed places for them: each appears near the raft when the Receiver is tuned to a frequency a note unlocked. With the option on, the Receiver's first frequency leads to the new order's first island, and the note you find there to the next. The frequency numbers written on the notes follow; the notes' text still speaks of Raft's own order. **Utopia**, the ending, stays last. Each story island holds its own keys and parts, so any order can be finished.

Ghost rafts

Abandoned rafts of Raft's own blocks lie on the sea and come up ahead while you sail: none in the first 1.5 km of a world, then about one every 3 km. Three sizes:

Size	How often	What is on it
Small	about 6 in 10	A few foundations, a barrel and a message in a bottle
Medium	about 3 in 10	A hut of walls and a roof, a barrel and a box, a captain's log, sometimes a rat or two
Large	about 1 in 10	A wide raft with huts, pillars and a lookout, a hoard chest and barrels, guarded by rats on the deck and screechers circling above

You can walk on their decks (they float like a real raft, the deck just above the water) and loot what is on them. Every player sees the same ghost raft: the host brings it, as an island of the map type `ghostraft`.

Private storages

A storage opens only for the player who built it. Looking at someone else's shows whose it is instead of "Open", and **E** does nothing. Storages built while the option was off (or before this version of the mod) have no builder and open for everyone. The host keeps who built which with the world, so it stays after saving, loading and joining again.

For every player

Every player in the world gets the host's options, also when joining later. The host can change them in a world: `WorldOptions` (F10) shows them, `WorldOptions +ghostrafts -privatestorage` switches them.

9.5 Islands while sailing

With the plan **Random islands** (or a plan with random islands on), islands turn up by chance while you sail: every island you have saved or downloaded, plus brand-new generated ones and the map types listed in `spawnpool.txt` (section 10). The group **Islands while sailing** in the World settings window chooses which of them this world may meet. Its button, **CHOOSE ISLANDS...**, says how many take part (all 42, or 30 of 42) and opens the list:

- one row per island or kind of island, each with a **tick box**: your own islands by name (with their size and date), **New ... islands** for each map type (a new sandbar, wreck, atoll... each time) and **Brand-new generated islands**;
- untick the ones this world shouldn't have;
- the **search** field narrows the list (type part of a name), and **Tick shown** / **Untick shown** do every row shown, for example all your test islands at once.

Only what you untick is kept, so islands you make or download later join older worlds too, unless you untick them when you make a new world. The choice belongs to the world (saved with it, so it stays when another player hosts the world later), and the next new world starts from it. In a world the host can change it with `WorldIslands -<island> / +<island> / all`; `WorldIslands` alone shows the list.

Islands that a quest, an island's rule or a world plan brings (section 6.4, section 7) come anyway: the list is only about islands by chance.

9.6 The level up system

Levels come to a world with an island made with **Level up system: On**. You switch it on in the editor's **Island** tab (Rules), or with the generator's **Level up** choice. Once such an island has appeared in a world, levels are on there for good, for every player. A world without one plays as Raft always does.

The switch in the Island tab's Rules.

Earning EXP

Hit a monster and the EXP it gave you floats up over it. Each hit gives the share of the monster's EXP that it took off its health, so killing it gives all of it. If you fight it together with a friend, each of you gets your own share. Chickens, goats, llamas, turtles, stingrays, dolphins, whales and people give nothing.

A hit on a warthog: +2 EXP.

Tougher monsters that bite harder are worth more, measured against Bruce the shark, who is worth **20 EXP**:

Monster	EXP	Monster	EXP
Bruce (shark)	20	Bear	13
Warthog	13	Polar bear	15
Screecher	12	Hyena	7
Puffer fish	9	Rat	7
Mama bear (Balboa)	67	Hyena boss	40

An island's own Hard or Boss animals are worth more than Raft's plain ones.

From level	EXP to the next	About
1 → 2	100	5 sharks
2 → 3	200	10 sharks
3 → 4	400	20 sharks
4 → 5	600	30 sharks
then	200 more each level	10 more sharks each level

Levelling up and spending points

A box shows when you reach a new level. **Click it** (in a menu, where the mouse is free) or press **K** to spend your points. The **EXP bar** is one more of Raft's own stat bars, above thirst, hunger and health: a gold star on its badge, a gold fill, the level on the left and the EXP to the next level on the right. It glows for a moment

when you earn EXP. A + after the level means points are waiting. While Raft's inventory (**Tab**) is open, a **Stats** button sits next to the bar.

Level 2: two stat points to spend. The EXP bar is at the bottom left.

The EXP bar with its star, styled like Raft's thirst, hunger and health bars, and the Stats button while the inventory is open.

Every level gives **2 stat points**. Each point makes a stat **1% better**, and a stat takes at most 10 points (+10%):

Stat	A point makes it
Walk speed, Run speed, Swim speed	1% faster
Jump height	Jump 1% higher
Damage	1% more damage to monsters, with every weapon
Health	1% more maximum health

Stat	A point makes it
Hunger, Thirst	Drain 1% slower
Oxygen	Breath lasts 1% longer under water

The stats page (K): the level, the EXP, the monsters you defeated, and the nine stats. + puts a point in, - takes it back while the page is open.

All 90 points are there at level 46. After that the levels go on, without points.

Playing together: each player has their own level, and the host keeps it with the world. A player who joins again gets theirs back. The host works out everyone's EXP, so a monster is worth the same to everybody. Other players see a small gold **Lv 5** under your name.

10. Settings files

In `<Raft>\Mods\DynamicIslands\`. Text files: open them with Notepad. They explain themselves, and changes are picked up while the game runs.

`spawnpool.txt` (islands that appear on their own; the host's counts):

Setting	Default	What it does
<code>chancePerKm</code>	0.25	Chance that an island appears for each km the raft sails (0 to 1)
<code>minSpacing</code>	800	Metres kept between custom islands
<code>spawnDistanceMin</code> , <code>spawnDistanceMax</code>	250, 350	How far ahead of the raft an island appears
<code>unloadDistance</code>	800	Islands further away are unloaded (and come back when you return)
<code>regrowDays</code>	3	In-game days until harvested things grow back (0 = never)
<code>showOnReceiver</code>	1	Custom islands as green dots on Raft's Receiver (0 = no)
<code>defaultPlan</code>	Random islands	The plan new worlds get when none is chosen
<code>generated</code>	1	How often a brand-new generated island is picked (0 = never)
<code>generatedStyles</code>	all five	The styles generated islands can have
<code>generatedFlyingChance</code>	0.1	The chance a generated island flies
<code><island name> <weight></code>	<code>* 1</code>	Which of your islands take part (<code>*</code> = every island not listed; weight 0 leaves one out)
<code>type:<map type> <weight></code>	sandbar, wreck, atoll, sunken	Map types that take part

Other files:

File	What it holds
<code>*.island</code>	Your islands (and the ones you installed from packs)
<code><name>_<hash>.island</code>	Islands downloaded from a host, or a version a saved world keeps after an update
<code>exports\</code>	Packs you exported (<code><name>.zip</code>), and <code>exports.json</code> (what you filled in, so the next export is the next version)
<code>import\</code>	Put packs you got here to install them (Import...)
<code>library\installed.json</code>	What each installed pack wrote (so it can be updated and removed)

File	What it holds
plans*.plan	World plans
world_rules.txt, randomizer.txt	Your last World settings choices (monsters, build cost, extra options, islands left out; the randomizer), the start for the next new world
worlds\<world>.txt	Each world's custom islands and their state (what was used, quests, journal, levels, settings); the world's own folder carries a copy, CustomIslands.txt
groups\, stamps\	Your saved object groups and terrain stamps
generator_presets\	Your generator presets (Save these settings...)
notice.txt	That you folded the alpha box, for this version of the mod

11. Console commands

Press **F10** for RML's console.

Command	Where	What it does
SpawnIsland <name> [distance] [height]	World, host	An island ahead of the raft (default 250 m)
RemoveIsland <name> / RemoveIsland all	World, host	Removes custom islands
ListIslands / ListSpawned	Anywhere / world	Your saved islands / the world's custom islands with their distance
SpawnPool	World	Which islands appear on their own, and how often
CustomIslandsAuto on / off	World, host	Automatic islands on or off for this world
WorldPlan / WorldPlan <name>	World	The world's plan and its rules / give it another plan (host)
Randomizer / Randomizer <off/light/normal/wild> [-part] [+part]	World	What the randomizer does here / change it (host)
WorldOptions / WorldOptions +option -option	World	The world's World settings / change them (host; blueprints, storyorder, ghostrafts, privatestorage)
WorldIslands / WorldIslands - <island> / +<island> / all	World	Which islands turn up by chance while sailing in this world / leave one out, let it take part again, all of them (host)
Monsters / Monsters <level>	World or main menu	The monster difficulty / change it (host; at the main menu: the next new world)
BuildCost / BuildCost <0-100>	World or main menu	The build cost / change it (host; at the main menu: the next new world)
LoadEditor	Main menu	Opens the editor

The editor's own commands (SaveIsland , GenerateIsland , SetStyle ...) are in the [README](#).

12. Questions and problems

No islands appear while I sail. Run `SpawnPool`: are automatic islands on, and is the pool empty? The plan may be "No custom islands" (`WorldPlan`). Islands appear only where there is room: near Raft's own islands they wait until the sea is clear. `SpawnIsland <name>` places one right away.

K does nothing, and there is no level bar. The level up system is off in this world. It comes on once an island made with **Level up system: On** has appeared in the world (see [section 9.6](#)).

A friend's storage won't open. The world has **Private storages** on (9.4): a storage opens only for the player who built it. The host can switch it off with `WorldOptions -privatestorage`.

The Receiver led me to the wrong story island / the blueprint isn't where the wiki says. The world has **Story islands in a new order** or **Scrambled blueprints** on (9.4); `WorldOptions` shows which.

One of my islands never turns up. It may be unticked for this world (9.5): run `WorldIslands`, and `WorldIslands +<island>` lets it take part again. Its weight in `spawnpool.txt` may also be 0.

Load World is greyed out. Raft is offline from Steam. Check that Steam is online and restart Raft.

My island is far away / I can't find it. Build Raft's Receiver: custom islands are green dots with their distance.

I can't get onto a flying island (or a cliff island). Build stairs or pillars up from the raft. The generator's reach line tells a builder beforehand.

A friend can't see my island. Every player needs the mod, and the host's islands are the ones that count. Island files are sent to players who join; they appear as `<name>_<hash>.island` in their folder.

Where are my islands? In `<Raft>\Mods\DynamicIslands\` as `<name>.island`. To give one to a friend, **Export...** it (4.7): the pack has the islands it brings too.

The story stopped: the next island never came. The host is told on the screen when a plan (or an island's rule) needs an island that isn't on the host's PC - usually after someone else started hosting the world. Install the pack or library entry the message names, or ask the player who made the world to export the plan. For a world saved before worlds kept their own plan, the plan file itself must be on the host's PC (see the table in [section 8](#)).

An installed island has an odd name like "Harbor (First Voyage)". You had a different island called "Harbor", so the pack's was installed under that name instead of replacing yours.

A pack won't install. The Import window says why: it may be made for a newer version of the mod, broken, or not an island pack at all.

The editor takes a moment to open. The first time after starting Raft it loads about 700 objects from Raft's islands; the loading box shows how far it is. After a Raft update it also scans Raft's other islands once, in the background (about half a minute; the object browser's status line says so).

Something went wrong. Press F10: the mod's messages start with `[CUSTOM ISLANDS]`. Raft's log is `%USERPROFILE%\AppData\LocalLow\Redbeet Interactive\Raft\Player.log`. To tell us about it, see [section 13](#).

More: the [README](#) (every feature, file and command, and the known limitations).

13. Reporting a problem

This is an alpha, and your reports are how it gets better. A good report lets someone who wasn't there see what happened, and make it happen again on their own PC. Please include:

1. **What happened, in detail.** What you did, step by step, from starting Raft or loading the world up to the problem: which island, which window or button, what you pressed or where you walked. Does it happen every time, now and then, or only once? Did it start after something (a new version of the mod, joining a friend, loading an older world)?
2. **What you expected** to happen if it had worked.
3. **Screenshots**, or a short video, if the problem can be seen: Steam's screenshot key (**F12**) or Windows' **Win+Shift+S**. If the console (**F10**) shows red messages, a screenshot of it helps too.
4. **The logs**, taken right after the problem and **before you restart Raft** (a new start replaces the log):
 - `%USERPROFILE%\AppData\LocalLow\Redbeet Interactive\Raft\Player.log`: Raft's log, with the mod's messages (`[CUSTOM ISLANDS]`). Paste the folder part of the path into the address bar of Windows Explorer to open it.
 - `Player-prev.log` in the same folder, if Raft crashed or you have started it again since: the previous start's log.
 - If Raft doesn't start with the mod at all: the mod loader's own log, `%APPDATA%\RaftModLoader\logs\hloader.log`.
 - **Playing together**: the logs of every player, the host's first, and who was the host.
 - The logs may show your Windows user name (in file paths) and your Steam name and id.
5. **The settings you used**:
 - **the versions**: Custom Islands (the box at the top right of the main menu says, for example, 3.0), Raft (bottom left of the main menu, for example 1.1.01), the mod loader (top of the main menu, for example v2.8.10), and which other mods you have;
 - **the world's settings**: Raft's game mode, the Custom Islands plan, and what you chose in World settings. In the world, press **F10** and run `WorldOptions`, `Monsters`, `BuildCost`, `Randomizer`, `WorldPlan`, `WorldIslands` and `SpawnPool`, then copy what they print (it is also in `Player.log`);
 - your settings files from `<Raft>\Mods\DynamicIslands\`: `spawnpool.txt`, and `world_rules.txt` and `randomizer.txt` if the problem is with a new world;
 - **single player or together**; if together: were you the host or did you join, and how many players were there.
6. **The islands and world plans involved**: their names, and the files or where to download them. Islands are `<Raft>\Mods\DynamicIslands\<name>.island`, world plans `<Raft>\Mods\DynamicIslands\plans\<name>.plan`. If the problem is in one world, add that world's island list, `<Raft>\Mods\DynamicIslands\worlds\<world>.txt`, and if you can, the world itself: zip its folder from `%USERPROFILE%\AppData\LocalLow\Redbeet Interactive\Raft\User\`.

Where to send it (either is fine):

- **GitHub**: open an issue on the mod's GitHub page, github.com/SwedenJohansson/DynamicIslands/issues (**New issue**). Give it a short title that says what went wrong ("A chest on my island is empty again after loading"), write the report, and attach the files (zip them if there are many).

- **Discord:** post it on the mod's Discord server, discord.gg/U7DfKY9tN, with the same details and the files attached.

A template to copy into the issue or the post:

What happened:

Steps to make it happen:

- 1.
- 2.
- 3.

What I expected:

How often: every time / now and then / once

Versions: Custom Islands 3.0, Raft 1.1.01, mod loader v2.8.10, other mods:

Single player or together: (host / joined, how many players)

World settings: (what WorldOptions, Monsters, BuildCost, Randomizer, WorldPlan, WorldIslands, SpawnPool print)

Islands and world plans used: (names, files or download links)

Attached: Player.log, Player-prev.log, screenshots, ...

This guide describes Custom Islands 3.0, the Experimental Alpha Release. It is kept up to date with the mod: every change to a feature updates this guide, the README and the PDF copy of this guide (docs/Custom-Islands-Guide.pdf) together.
